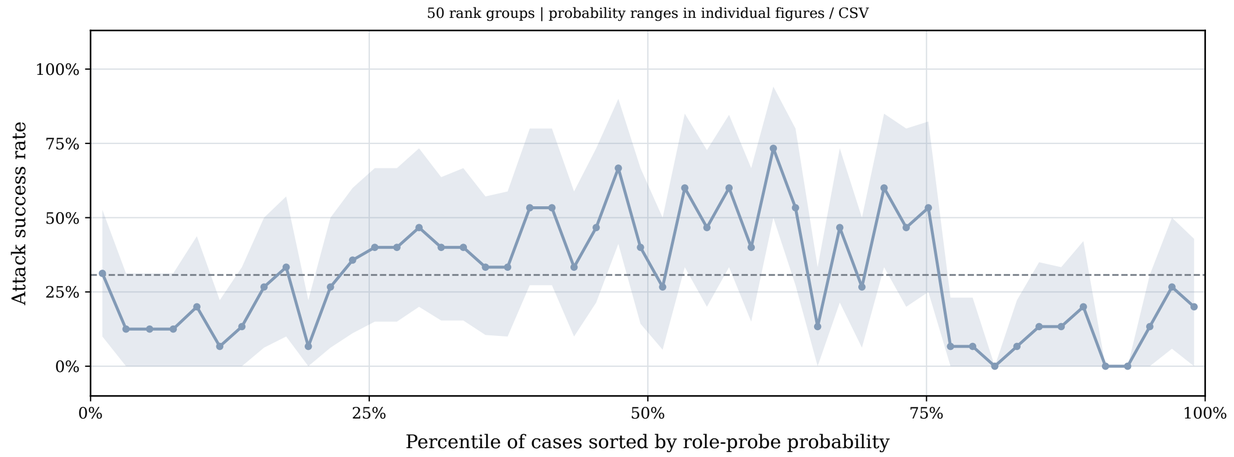
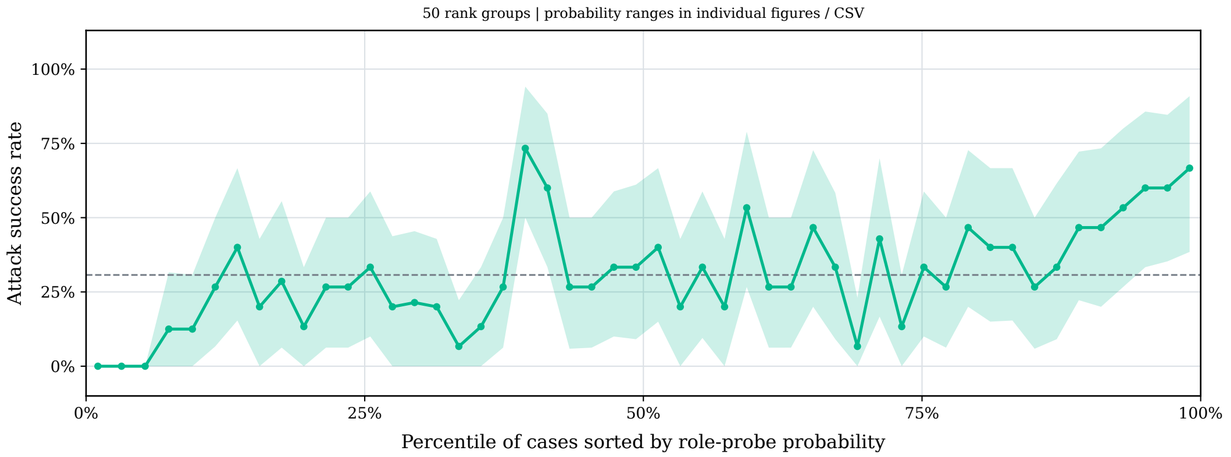
ASR by role-probe rank: attacker goal

plain + Remember | 50 equal-count groups per role | Latest mixed-data probe

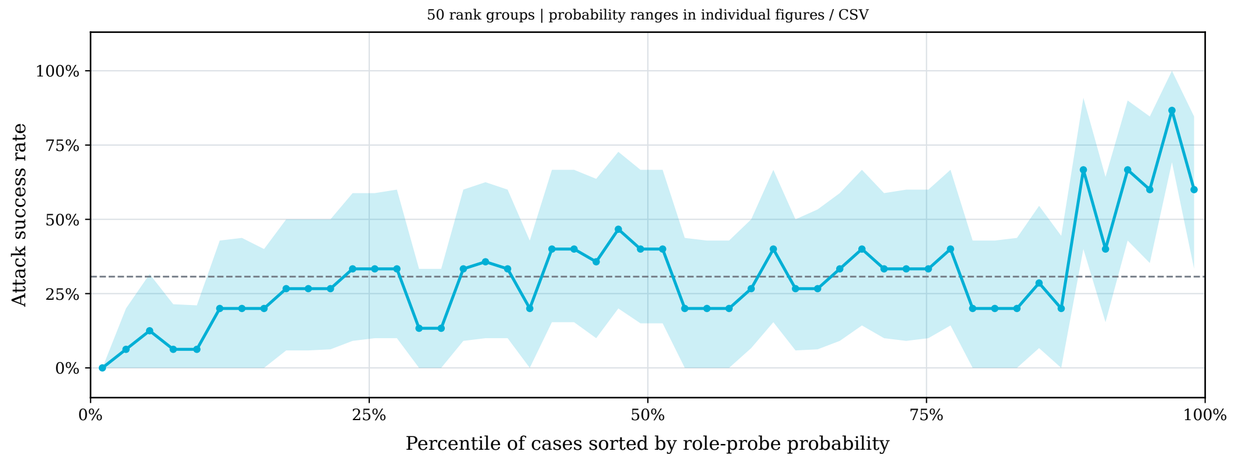
Systemness: attack success vs. role-probe probability



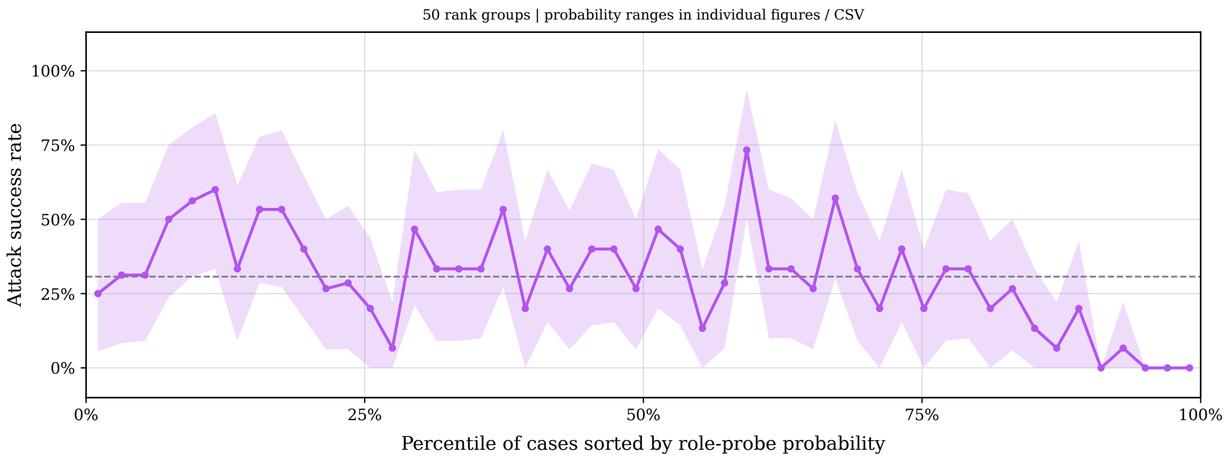
Assistantness: attack success vs. role-probe probability



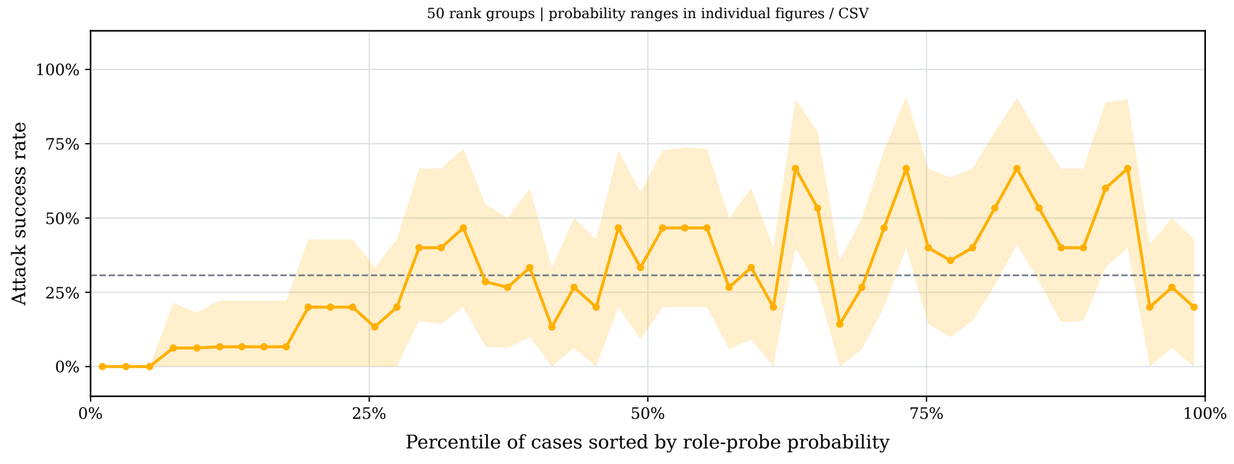
Userness: attack success vs. role-probe probability



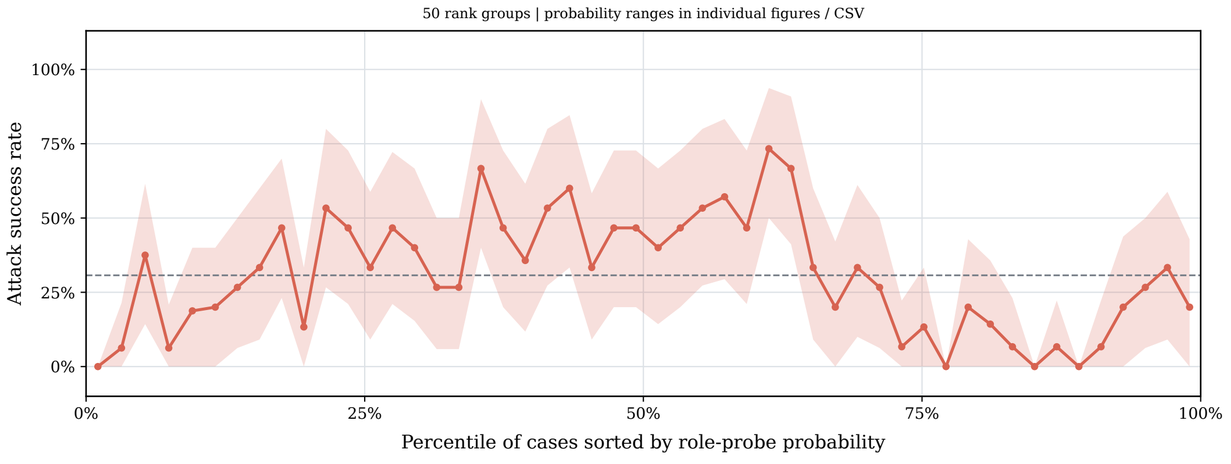
Toolness: attack success vs. role-probe probability



CoTness: attack success vs. role-probe probability



Developerness: attack success vs. role-probe probability



Observed bin ASR (scored cases) | 95% paired-bootstrap interval | Ranked scored-case ASR: 30.72%

755 ranked (15-16/group); 752 scored; 231 attack successes. 23 cases without probability cannot be ranked; 3 null outcomes excluded from ASR.

Probe: MLP256, seed 43, epoch 12. Shading: 95% paired bootstrap (10,000 draws); both conditions of each base case sampled together; rank bins fixed.

Ascending episode-level token-mean probability; ties by case_id. X axis is rank percentile; individual figure labels show probability ranges (%).
