GAM: template role probability vs attack success

Latest probe | Pooled vs Plain vs Remember | Suite-standardized estimated ASR

Unconstrained cubic P-splines; user-task grouped CV selects smoothing. 56 task clusters.

Shading: pointwise 95% task-bootstrap CI, conditional on chosen smoothing (1,000 refits).

Plain: 12/374 successes, confined to 3 tasks; uncertainty is substantial. Curves are model estimates, not binned observations.
