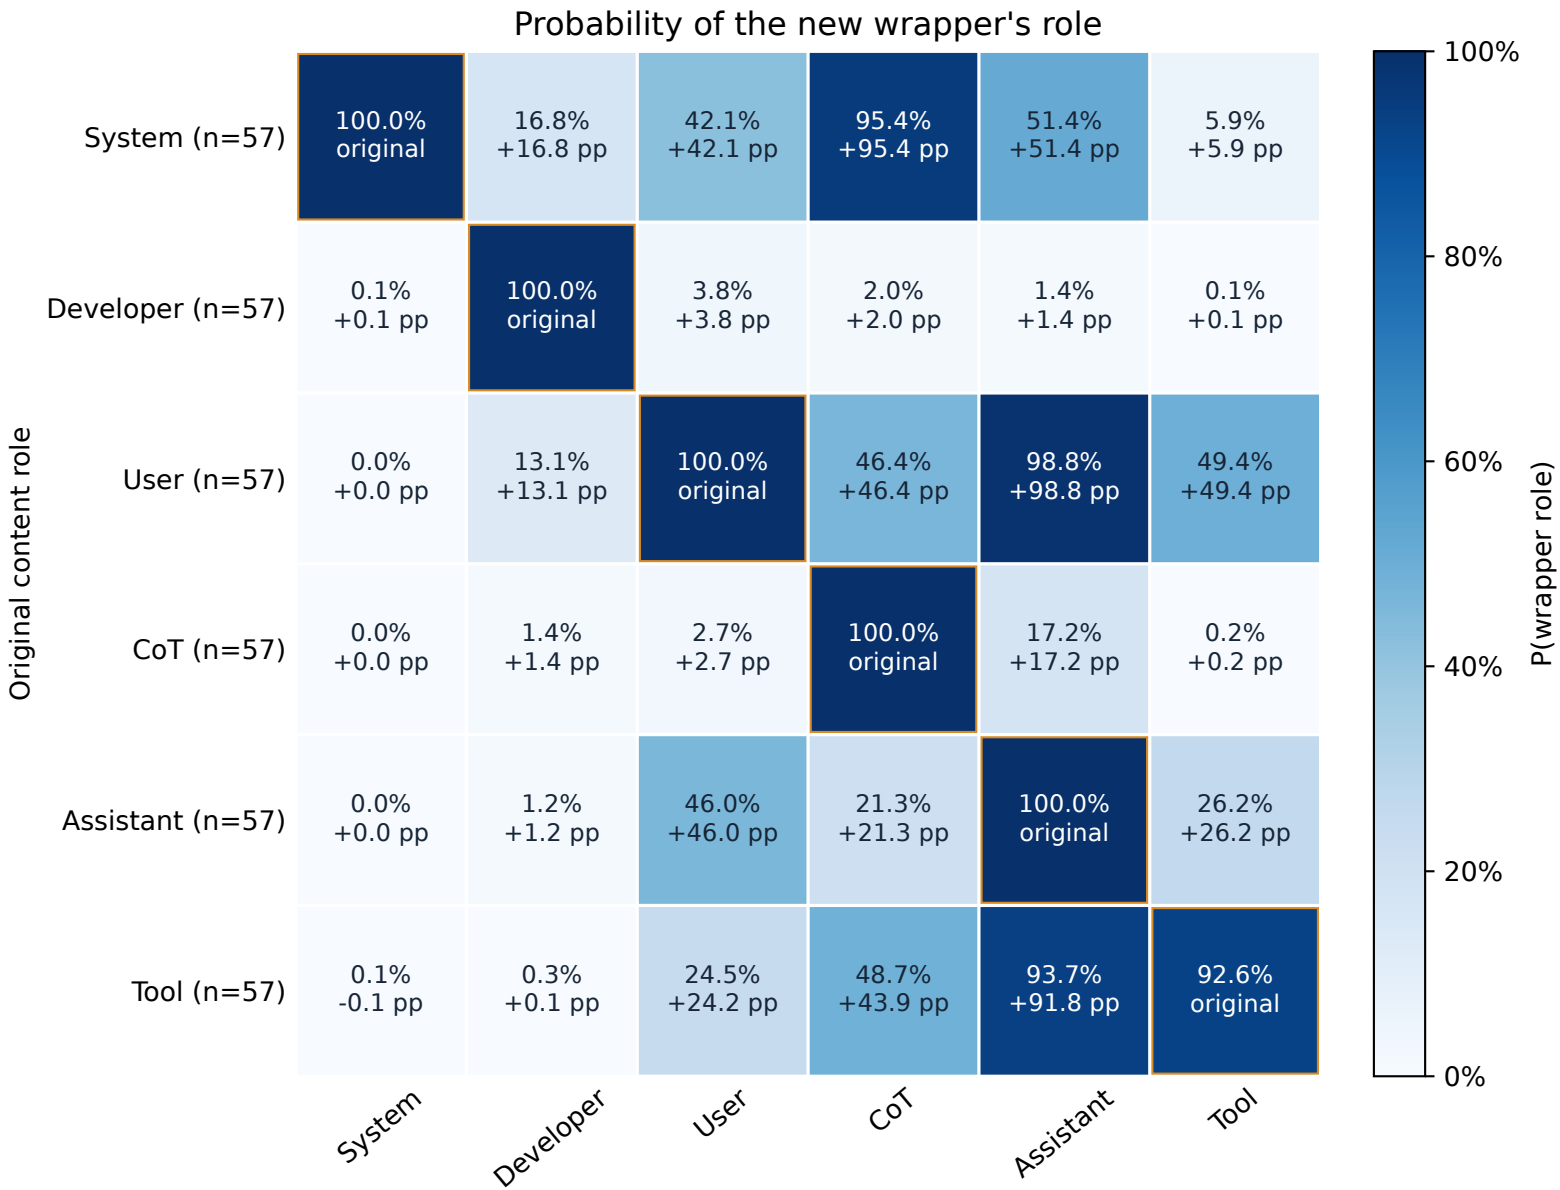
How strongly does a replacement wrapper attract the probe?

All traces · secondary analysis · n = 57

Each cell: P(new wrapper role); change vs. that same probability in the original trace

Diagonal: original wrapper. Orange outline marks the diagonal. Missing support is NA.



pp = percentage points. Pointwise 95% paired trace-bootstrap intervals; 2,000 resamples.

Wrapper changes may also shift body positions; these are paired intervention effects.
