Full six-role probe probabilities after each intervention

Single trace · descriptive pilot | Cell values are percentages

Each target body has eight readouts: original, strip, move, and five alternative wrappers.

Single trace; no confidence intervals. Full readouts and paired changes: full-role-probabilities.csv.
First occurrence of each role only. Wrapper edits may shift token positions; moving a block changes its causal context.
These are intervention effects on probe probabilities, not a causal percentage decomposition.
